

PROJECT ROADMAP

Problems

Problems

The first thing we needed to do was to find the problems around us about our topic.

Solution

After finding problem, what we needed was a solution and a idea of how we were going to implement that solution.

Work process

Now that we have both problem and solution and an idea so what are we waiting for lets get started here you can expect to see lots of flow chart explanation.

Advantages

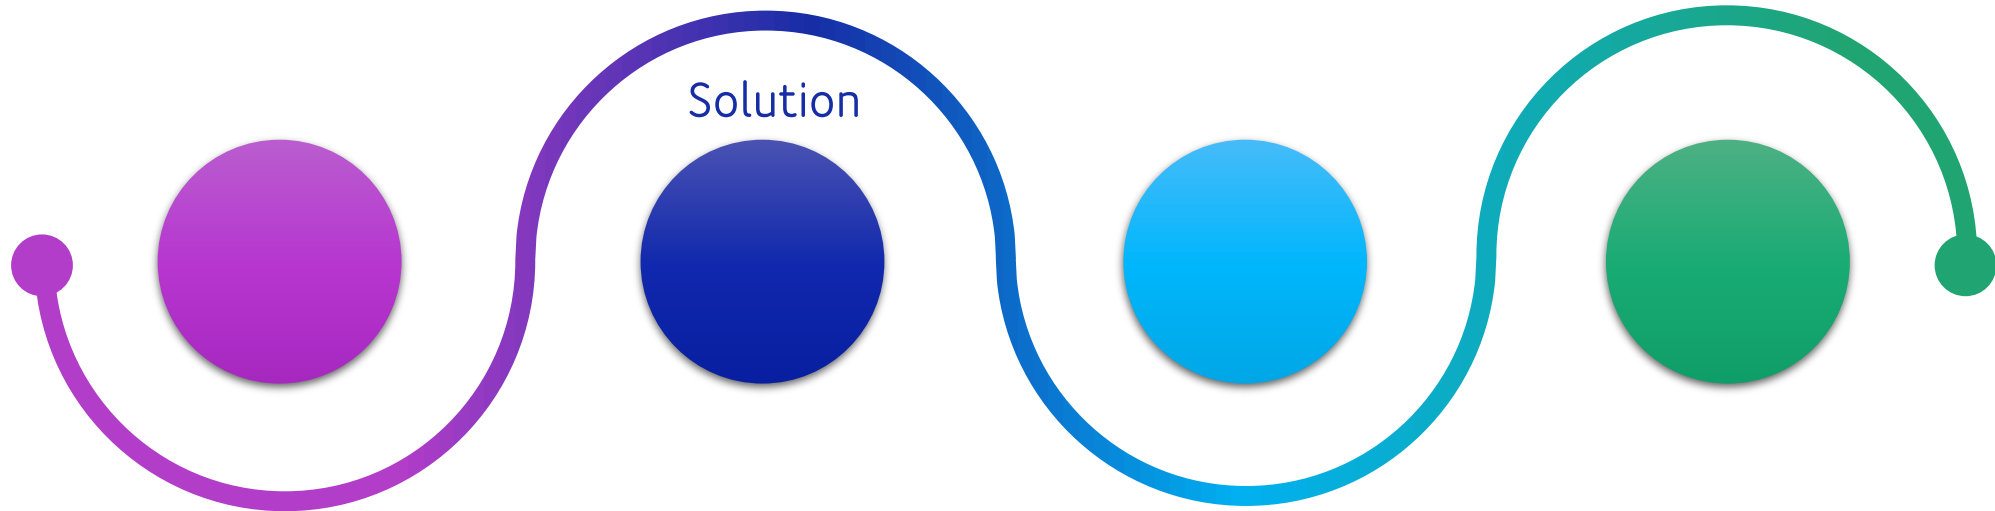

So you finally reached the end, till now you must have a basic idea about what we have in our mind and here we will talk about the advantages of implementing that same idea in society.

Problems

- Waste management which has a major impact on society.
- Managing and disposing of waste.
- Slow traditional process of manually monitoring wastes in garbage bins.
- Theft and damage of garbage bins

After finding problem, what we needed was a solution and a idea of how we were going to implement that solution.

Work process

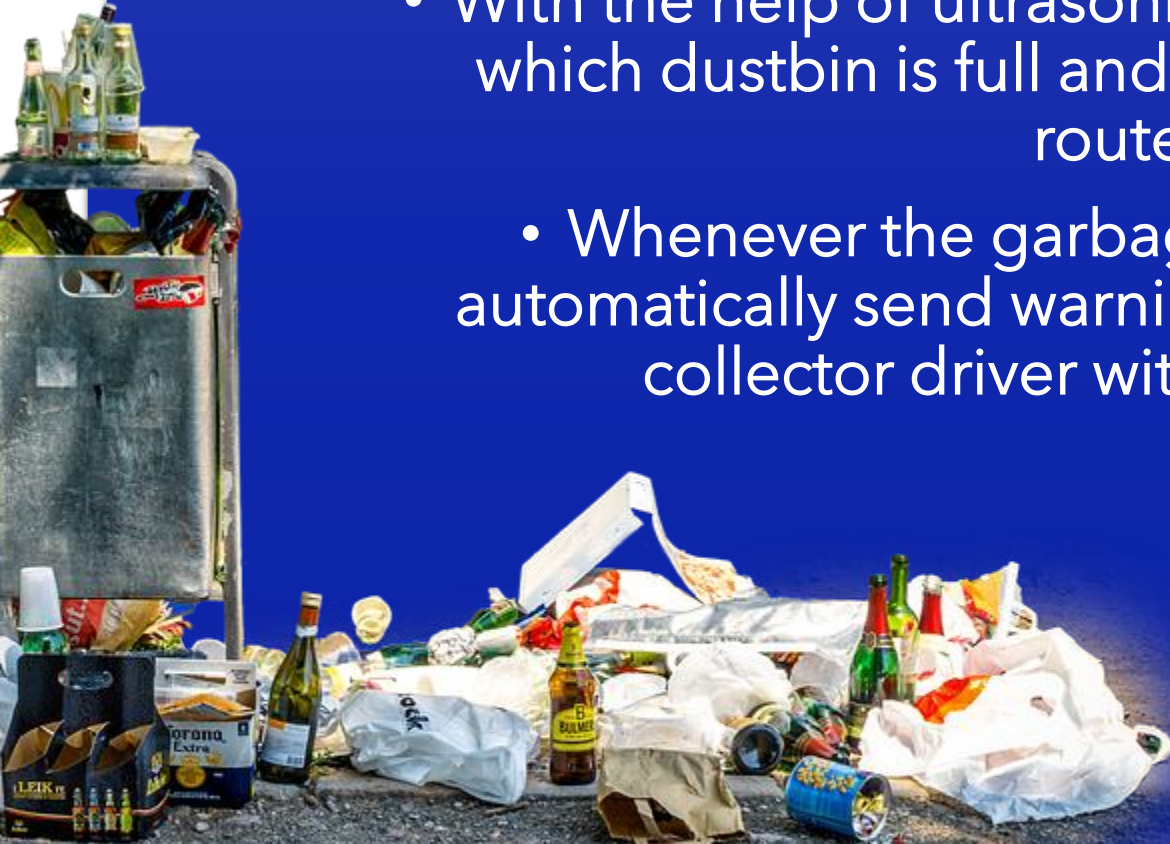

Now that we have both problem and solution and an idea so what are we waiting for lets get started here you can expect to see lots of flow chart explanation.

Advantages

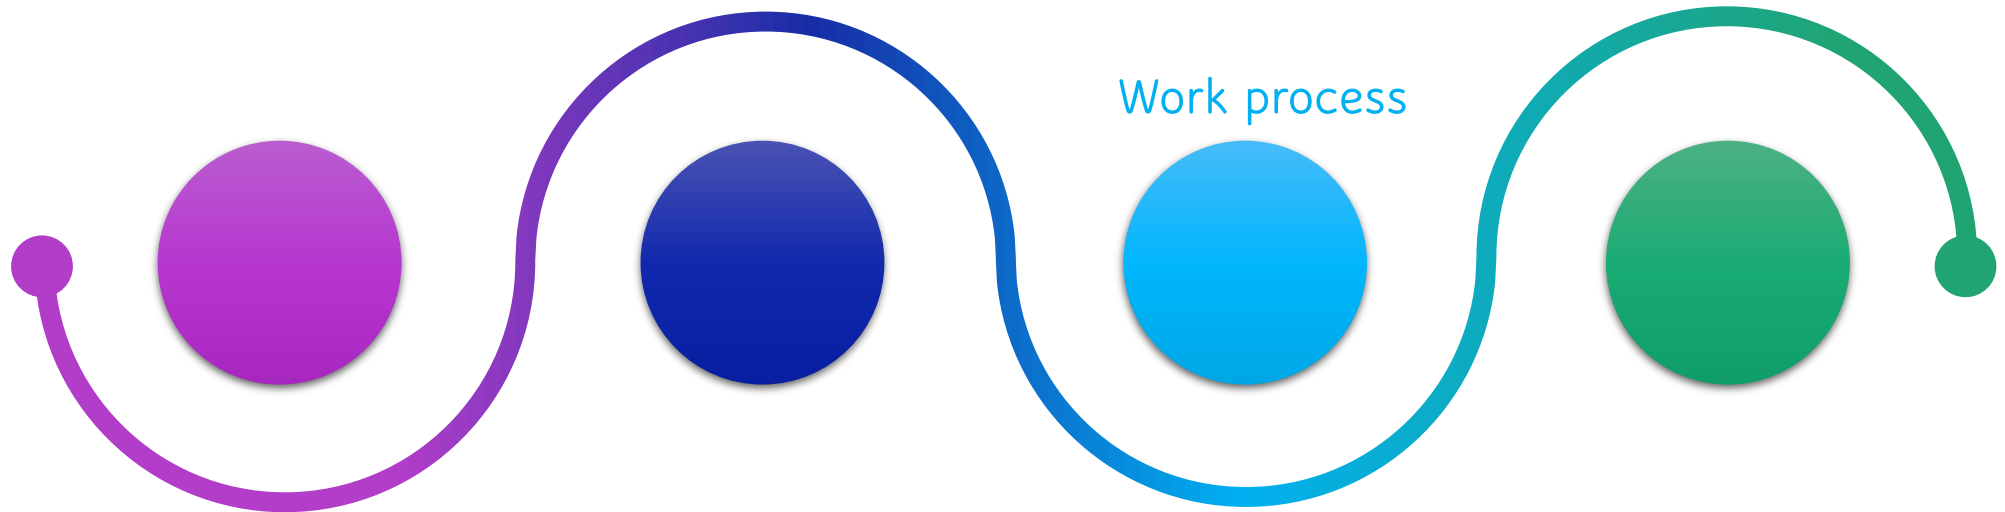

So you finally reached the end, till now you must have a basic idea about what we have in our mind and here we will talk about the advantages of implementing that same idea in society.

Solution

- Our model provides real time monitoring of various garbage bins in one time.
- Every garbage has its own id so driver won't get confused.
- With the help of ultrasonic sensors you can monitor which dustbin is full and workers can get a proper route map.
 - Whenever the garbage bin is 85% full it will automatically send warning message or SMS to the collector driver with dustbins location.
